PROJECT 01 · ONGOING PERSONAL PROJECT

ELECCIONES 2026

TOOLS

Built using Claude Code and scrapping data from the official national election body

PROBLEM

In Peru, corruption is not background noise. It is the norm. Every living ex-president is either in jail or under investigation. The JNE (national electoral body) makes candidate information publicly available, but the website is dense and difficult to navigate. Voters who want to compare candidates on policy, background, or track record have to work hard to find it. The design itself is making accountability harder.

GOAL

Make information easy to see and scan, without nudging voters toward any candidate.

PROBLEM

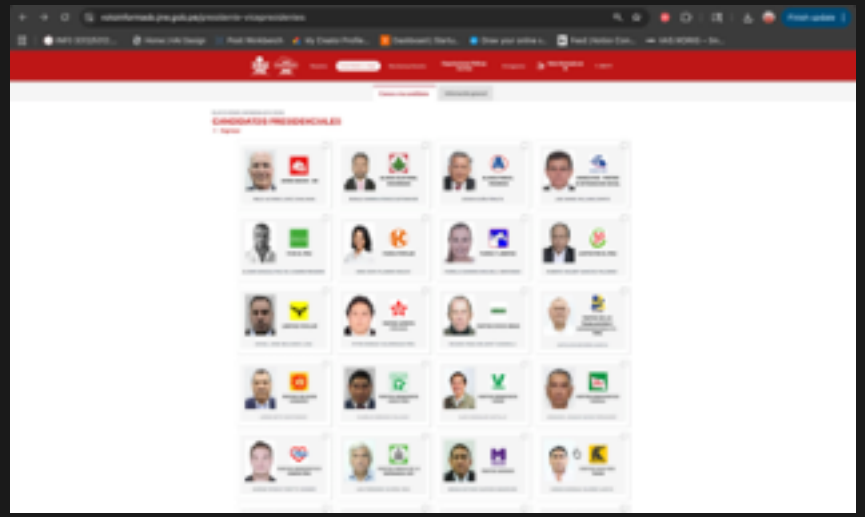
In Peru, corruption is not background noise. It is the norm. Every living ex-president is either in jail or under investigation. The JNE (national electoral body) makes candidate information publicly available, but the website is dense and difficult to navigate. Voters who want to compare candidates on policy, background, or track record have to work hard to find it. The design itself is making accountability harder

GOAL

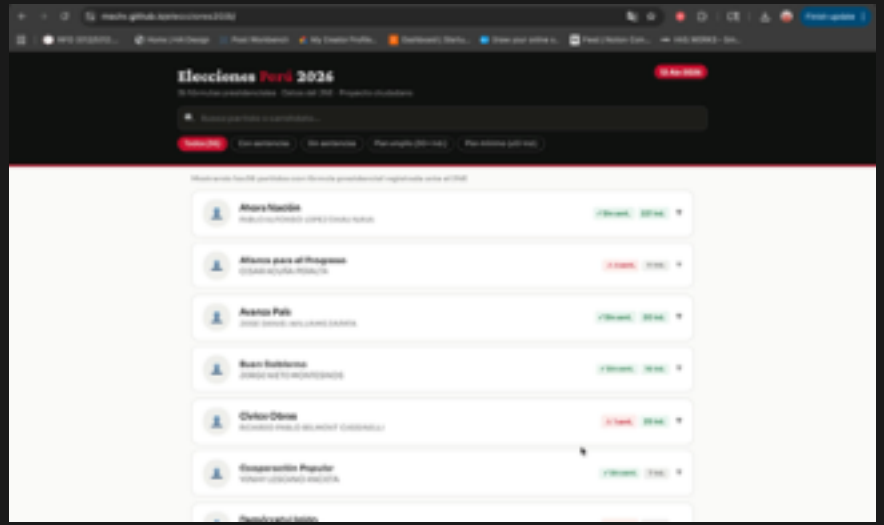
Make information easy to see and scan, without nudging voters toward any candidate.

TOOLS

Built using Claude Code and scrapping data from the official national election body



CURRENT JNE SITE



PROPOSED

APPROACH

Restructured the information architecture to surface policy positions, background, and track record in a scannable, comparable format.

KEY INSIGHT

The hardest design decision was not layout: it was deciding what to show and how much. Every choice about what to surface or suppress is implicitly an editorial decision. Neutrality is not a default. It has to be actively designed for.
